# 1. Scope

The DCIM Base Metrics Profile extends the DMTF Base Metrics Profile to add Dell specific implementation requirements for power related metrics. The profile standardizes the units and description for the metrics as well as provides static methodology for the clients to query the metrics without substantial traversal of the model.

The metrics covered in this profile are:

- For power:
  - Maximum power consumption metric in Watts,
  - Maximum power consumption metric in Amperes,
  - Minimum power consumption metric in Watts,
  - Energy consumption metric in kilowatt-hours (kWh),
  - Maximum power consumption metric in Watts for last hour, day, week,
  - Minimum power consumption metric in Watts for last hour, day, week,
  - Average power consumption metric in Watts for last hour, day, week,
  - Maximum headroom power consumption metric,
  - Instantaneous headroom power consumption metric,
- For inlet temperature
  - Maximum inlet temperature metric for last hour, day, week, month and year,
  - Average inlet temperature metric for last hour, day, week, month and year,
  - Inlet temperature time spent above thresholds.
- For Out-of Band sensors i.e., CPU, Memory, IO Utilization & System Utilization
  - Maximum utilization metric in percentage for last hour, day and week,
  - Minimum utilization metric in percentage for last hour, day and week,
  - Average utilization metric in percentage for last hour, day and week,
  - Peak Values in percentage.

The PeakReset( ) method provides the ability to reset the Peak utilization for a particular sensor to 0.

The PeakReset() method's return code values shall be as specified in below Table where the method execution behavior matches the return code description. The PeakReset( ) method's parameters are in specified in Table 65. No standard messages are defined for this method.

**Table 63.** CIM\_MetricService.PeakReset( ) Method: Return Code Values

Value	Description
0	Operation completed successfully
